

## **Throttle Settings Notice**

Following a recent update to the Throttle Settings on the Skylaunch Website I thought it prudent to point out how they differ from some of the settings on our placards in our winch.

Our Winch throttle quadrant is slightly different to the later winches and produces a different power setting. As an example the Skylaunch latest setting for a Std Cirrus shows an E setting where our placards show a C setting.

I've discussed the settings with the current Cirrus owners and we've agreed a C or possibly a D setting would be more appropriate.

Please follow the placard settings on our control panel for our gliders. If you have any concerns about settings then you need to ask the launch point to confirm the setting type with the pilot.
